

Thomas D. Smith

Senior Software Architect | .NET, TypeScript, Data Systems, SDLC

Atlanta, GA | Hybrid / onsite / remote | (470) 862-4855 | thomas@tsmithcode.ai | tsmithcode.ai

Hands-on software architect for business-critical internal systems, modernization work, data flows, release quality, and technical ownership. Strong fit when a team needs a calm senior engineer who can understand the system, reduce change risk, and leave the work easier to operate.

TARGET ROLES

- Senior Software Architect
- Solution Architect
- Principal / Staff Software Engineer
- .NET Architect
- Enterprise Integration Architect
- Software Engineering Consultant

CORE TOOLS

- .NET
- C#
- VB.NET
- TypeScript
- JavaScript
- SQL
- APIs
- Power BI
- Azure DevOps
- CI/CD
- Git
- Testing

STRONG MARKETS

- Energy
- Infrastructure
- Data centers
- Manufacturing
- Operations
- Internal platforms

SOFTWARE STRENGTHS

.NET C#/VB.NET systems

Stabilization, modernization, service boundaries, desktop workflows, SQL-backed applications, and supportable deployment paths.

TypeScript and JavaScript delivery

Maintainable interfaces, workflow screens, integration layers, and operating tools that teams can own after handoff.

Architecture and SDLC

Decision records, release gates, observability, technical communication, quality checks, and practical ownership models.

Data management

Data cleanup, reporting models, operational dashboards, API flows, and reliable movement between source systems.

RECENT EXPERIENCE

IBM (Contract)

2024 - 2025

Software Architect / Platform Modernization

- Owned modernization slices for specialized internal-platform applications, including service structure, maintainability, and delivery quality.
- Improved development workflow with source control discipline, release notes, build verification, and clearer technical handoff.
- Helped connect platform behavior, operating constraints, and stakeholder expectations into scoped implementation decisions.

Habasis America

2022 - 2024

CAD Drafter

- Built workflow automation, request tracking, data extraction, and reporting tools for manufacturing and operations teams.
- Reduced manual coordination by turning repeated business activity into clearer intake, status, and management views.
- Partnered with operators, managers, and technical stakeholders to move improvements from spreadsheet habits into supportable systems.

1Path Systems

2021 - 2022

Senior Software Architect

- Led architecture and delivery for internal software, integration, and business application improvements.
- Balanced hands-on engineering with planning, estimation, stakeholder communication, and ownership of technical outcomes.

Thomas D. Smith

Software architecture, modernization, data systems, and delivery ownership

Atlanta, GA | Hybrid / onsite / remote | (470) 862-4855 | thomas@tsmithcode.ai | tsmithcode.ai

REVIEW SIGNALS

- Business-critical system ownership
- Hands-on architecture and delivery
- Clear written technical communication
- Modernization without avoidable disruption
- Practical support and handoff discipline

CONTACT PATH

- Start with role, work model, timeline, and target system.
- Share sensitive code, records, or internal diagrams only after the right channel is agreed.

HANDOFF ARTIFACTS

- Readable implementation notes and tradeoff records
- Data ownership and integration assumptions
- Release, rollback, and support considerations
- Clear next-step options for leaders and operators

EARLIER EXPERIENCE

Daikin Applied

2019 - 2021

Senior IT Applications Developer

- Delivered business application improvements across .NET, data, reporting, and enterprise workflow needs.
- Supported operating teams with maintainable software changes, troubleshooting, and cross-functional technical communication.

Fry Reglet

2017 - 2019

Operations Technology Specialist

- Created operational tools, reporting improvements, and workflow support for manufacturing and executive visibility.
- Turned process knowledge into repeatable systems that improved quote, tracking, and management routines.

SELECTED SOFTWARE PROOF

- Modernized internal applications while preserving trusted behavior and user workflows.
- Built reporting and data flows that turned scattered operational activity into reviewable management views.

- Improved release confidence with clearer ownership, documentation, version control, and deployment practices.
- Translated ambiguous business requests into scoped technical decisions, delivery slices, and supportable handoff.

ARCHITECTURE DELIVERY PATTERN

Understand the system

Map the current behavior, data owners, users, release path, and highest-risk assumptions before changing the work.

Shape the first slice

Turn broad requests into one reviewable improvement with success criteria, rollback thinking, and a practical handoff path.

Build for ownership

Use readable code, clear data flow, testable behavior, documentation, and operating notes so the team can support it.

Reduce the next risk

Leave decisions, constraints, and follow-on options visible instead of burying important knowledge in private memory.

Public resume content is intentionally generalized. Private code, customer records, internal diagrams, credentials, compensation posture, and employer-confidential implementation details should move through the right review channel.
